CANADIAN STANDARDS ASSOCIATION ACTIVITY IN ACOUSTICS

2002 UPDATE

Tim Kelsall
Hatch Associates, 2800 Speakman Drive, Mississauga, Ontario L5K 2R7
tkelsall@hatch.ca

ABSTRACT

This article gives an update of Canadian Standards activities in Canada, especially those of the Canadian Standards Association. CSA currently have 11 Acoustics Standards and two more with significant acoustics content. Two committees are responsible for these standards. Z94 is responsible for one standard. Z107, through a variety of subcommittees involving many Canadian acousticians and industry representatives write and review most other standards for the Canadian Acoustics community. An update is given of the main activities and future directions of these groups.

SOMMAIRE

Cet article présente une mise à jour des activités de normalisation au Canada pour 2002, tout particulièrement celles de l'Association canadienne de normalisation (ACNOR). L'ACNOR a présentement 11 normes acoustiques et deux autres comportant un contenu acoustique important. Deux comités sont responsables pour ces normes. Z94 est responsable pour une norme. Z107, par divers sous-comités comprenant plusieurs acousticiens canadiens et représentants de l'industrie rédigent et passent en revue la plupart des autres normes pour la communauté acoustique canadienne. Une vue d'ensemble de leurs activités premières ainsi que de l'orientation future de ces groupes y est présentée.

Introduction

The Canadian Standards Association is the largest standards writing body in Canada and one of the largest in the world. There have been CSA standards in Acoustics for over 25 years. The Z94 Protective Devices Committee and the Z107 Committee on Acoustics and Noise Control are active in many areas. Many Canadian acousticians put in a great deal of volunteer effort each year in writing and reviewing acoustics standards. This article is intended to give an update for 2002 of acoustics standards activity in Canada, concentrating on CSA acoustical standards.

Committee Activities

There are two CSA Technical Committees in Acoustics:

Z94 – Hearing Protection

Z94 is responsible for the Hearing Protection Standard Z94.2 which defines Type A, B, and C type hearing protectors and is widely referred to in occupational noise regulations. They have recently approved a major new version of this standard in light of changes to the US hearing protector standards and procedures. This will mean the introduction of user-fit hearing protector measurements, similar to those used by ANSI and now recognized as being more representative of how hearing protectors are used in practice than the old technician-fitted testing methods.

Z107 Acoustics and Noise Control

Z107, the Acoustics and Noise Control Technical Committee, is responsible for all other CSA Acoustics standards and liaises with Canadian activities on ANSI, ASTM, IEC and ISO standards. Several members belong to these organisations’ committees or Z94 and provide liaison to them.

The committee meets twice a year, once during the Canadian Acoustics Week and once in the spring. The latest meeting at the PEI conference was well attended. It reviews progress by each subcommittee and votes on any new work proposals. The main committee is the last technical hurdle for a standard. The CSA will then have their editors put it into final form. The steering committee, to which the main committee reports, approves work and reviews completed standards, however they cannot make technical changes.
New members are encouraged and anyone interested may contact Cameron Sherry, the Chairman, or the author, the vice chair. Those interested in a particular working group should contact the working group chairs listed below.

Table 1 shows all the Canadian Standards currently in force and also lists two standards whose Acoustics sections were written with the assistance of the Z107 committee. This table will also soon be found at the CAA website and will be kept up to date there. Meanwhile the list can be found at

Most of the work of the committee is carried out by its sub-committees who are responsible for the following standards:

**Hearing Measurement**, chaired by Tang Chow, responsible for CAN3-Z107.4-M86 Pure Tone Air Conduction Audiometers for Hearing Conservation and for Screening and CAN/CSA-Z107.6-M90 Pure Tone Air Conduction Threshold Audiometry for Hearing Conservation

**Vibration**, chaired by Tony Brammer, which provides liaison between Z107 and the Technical Advisory Committee of Standards Council on ISO standards on vibration. Tony is active on the ISO group for ISO 2631

**Powered Machines**, which no longer has standards of its own but recommends adopting or endorsing ANSI, SAE or ISO standards.

**Industrial Noise**, chaired by Tim Kelsall, responsible for the following standards:

- **Z107.52-M1983 (R1994)** Recommended Practice for the Prediction of Sound Pressure Levels in Large Rooms Containing Sound Sources. This standard is in need of major updating and a chair is being sought to do this work.

- **Z107.53-M1982 (R1994)** Procedure for Performing a Survey of Sound Due to Industrial, Institutional, or Commercial Activities. This standard will be replaced with ISO1996. A working group chaired by Chris Krajewski and including several Ontario consultants is examining using 1996 as a way of updating the way tonal and impulse sounds are handled in community noise. They are currently running round robin tests of the procedures with various sample sounds. Stephen Keith of Health Canada is acting as liaison with the ISO committee. The Canadian version will include an informative annex relating the standard to the Canadian context.

- **CAN3-Z107.54-M85 (R1993)** Procedure for Measurement of Sound and Vibration Due to Blasting Operations. A working group, chaired by Ramani Ramakrishnan, is revising this standard. This activity is just getting started.

- **CAN/CSA-Z107.55-M86** Recommended Practice for the Prediction of Sound Levels Received at a Distance from an Industrial Plant. A joint CSA/ANSI working group co-chaired by Rich Peppin and Tim Kelsall is looking at ISO9613 for adoption or endorsement. This standard was originally written by an ISO working group chaired by Joe Piercy. It may ultimately replace or become the basis for a revised version of Z107.55.

- **Z107.56-94** Procedures for the Measurement of Occupational Noise Exposure is referenced in Federal and some provincial regulations and is being updated by a working group chaired by Alberto Behar.

- **Z107.58-2002** Guidelines For Machinery Noise Emission Declarations Levels was written by a group chaired by Stephen Bly and should be available by the time this article is published. It is a voluntary guide on noise emission declarations for machinery to be used in Canada and is compatible with European regulations to allow Canadian machinery to be sold into that market.

A Noise Emission Declaration is a statement of sound levels produced by equipment, which would usually be included with the instruction or maintenance manual. Measurements are made according to ISO standards and include estimates of the likely variability of the measurements. Canada recommends use of a declaration stating the level and uncertainty as two numbers, although in some cases they may be added together into a single number.

In addition, the committee undertakes reviews of proposed federal and provincial regulations, often at the request of the regulators, and other activities affecting industrial noise. At the last meeting a review of recent research on the effect of low frequency sounds on worker health by Health Canada was discussed. The subcommittee agreed with the conclusion that there was no evidence at present requiring a change in standards.

**Transportation Noise**, chaired by Soren Pedersen, responsible for CAN/CSA-Z107.9-00: Standard for Certification of Noise Barriers. This standard is an adaptation of the Ontario MTO Highway Noise Barrier specification. It provides municipalities, developers, road and highway departments, railways and industry with a standard specification which
can be used to define the construction of barriers intended for long term use in Canadian conditions.

Specific manufacturers’ barrier designs are certified as complying with the standard in such areas as: materials used, weathering and corrosion resistance testing, STC, NRC, etc. Each barrier installation is reviewed and certified for compliance with such items as footings design, material sample testing, welding, caulking, backfilling, etc.

The US Highway Barrier Design Manual is already harmonised with the CSA standard, as is the Ontario Provincial Standard.

Editorial, chaired by Alberto Behar, (which reviews all proposed standards) and is responsible for reviewing and endorsing ANSI S1.1-1994 Acoustical Terminology.

Building Acoustics, chaired by David Quirt, does not have its own standards, but endorses or adopts other standards, mostly from ASTM.

Instrumentation and Calibration, chaired by George Wong, which liaises with Canadian activities on ANSI, IEC and ISO instrumentation standards and endorses or adopts these standards.

Liaison with the Canadian Steering Committee for ISO TC43 and TC43(1), chaired by Krish Krishnappa.

Reviewing other standards

A large part of the committee and subcommittee work is reviewing standards written by other standards writing bodies, such as ANSI or ISO, for adoption or endorsement by Canada. Whenever possible, as global harmonisation becomes more important, CSA adopts or endorses international standards rather than writing their own. In areas where standards apply to goods coming from or going to other countries, use of international standards makes considerable sense.

Adopting a standard, i.e. republishing it, with changes or additions if necessary, costs less than half the cost of writing a new standard. Endorsing, which means that the standard has been reviewed and found suitable for Canadian use is the least expensive option, but less useful because the standard is not so readily available.

Currently there are 24 standards from ANSI, ISO and ASTM endorsed. They are listed in Table 1 following the CSA standards.

Table 1 - CSA Acoustics Standards

Endorsed Standards

ANSI S1.4-1983 Specification for Sound Level Meters (R2001)

ANSI S1.11-1986 Specifications for Octave-band and Fractional (R1998) Octave-band Analog and Digital Filters

ANSI S1.13-1995 Measurement of Sound Pressure Levels in Air (R1999)

ANSI S12.31-1990 Precision Methods for the Determination of (R1996) Sound Power Levels of Broad-band Noise Sources in Reverberation Rooms

ANSI S12.32-1990 Precision Methods for the Determination of (R1996) Sound Power Levels of Discrete-frequency and Narrow-band Noise Sources in Reverberation Rooms

ANSI/ASTM Standard Test Method for Sound Absorption and C423:00 Sound Absorption Coefficients by the Reverberation Room Method

ASTM E596-96 Standard Test Method for Laboratory Measurement of the Noise Reduction of Sound-isolating Enclosures

ASTM E795-00 Standard Practices for Mounting Test Specimens During Sound Absorption Tests

ASTM E989-89 Standard Classification for Determination of (1999) Impact Insulation Class (IIC)

IEC 60651-2001 Sound Level Meters

SAE J919-1995 Sound Measurement – Off-road Work Machines – Operator Singular Type

SAE J1096-2000 Measurement of Exterior Sound Levels for Heavy Trucks under Stationary Conditions

The ABC's of Noise Control
Comprehensive Noise Control Solutions

H.L. Blachford Ltd.'s Comprehensive Material Choices Noise treatments can be categorized into three basic elements: Vibration dampers, Sound Absorbers and Sound Barriers.

Vibration Dampers
It is well known that noise is emitted from vibrating structures or substrates. The amount of noise can be drastically reduced by the application of a layer of a vibration damping compound to the surface. The damping compound causes the vibrational energy to be converted into heat energy. Blachford's superior damping material is called ANTIVIBE and is available in either a liquid or a sheet form.

ANTIVIBE DL is a liquid damping material that can be applied with conventional spray equipment or troweled for thicker applications. It is water-based, non-toxic, and provides economical and highly effective noise reduction from vibration.

ANTIVIBE DS is an effective form of damping material provided in sheet form with a pressure sensitive adhesive for direct application to your product.

Sound Barriers
Sound barriers are uniquely designed for insulating and blocking airborne noise. The reduction in the transmission of sound (transmission loss or "TL") is accomplished by the use of a material possessing such characteristics as high mass, limpness, and impermeability to air flow. Sound barrier can be a very effective and economical method of noise reduction.

Barymat® is a sound barrier that is limp, has high specific gravity, and comes in plastic sheets or die cut parts. It can be layered with other materials such as acoustical foam, protective and decorative facings or pressure sensitive adhesives to achieve the desired TL for individual applications.

Sound Absorbers
Blachford's Conasorb® materials provide a maximum reduction of airborne noise through absorption in the frequency ranges associated with most products that produce objectionable noise. Examples: Engine compartments, computer and printer casings, construction, forestry and agriculture equipment, buses and locomotives.

Available with a wide variety of surface treatments for protection or esthetics. Materials are available in sheets, rolls and die-cut parts – designed to meet your specific application.

Suggest Specific Materials or Design
Working with data supplied by you, H.L. Blachford Ltd. will recommend treatment methods which may include specific material proposals, design ideas, or modifications to components.

ISO 9001 A Quality Supplier
The complete integration of:
- Experience of over forty years
- Quality-oriented manufacturing
- Extensive research and development
- Problem solving approach to noise control
